REMOTELY MONITOR GROWTH CONDITIONS

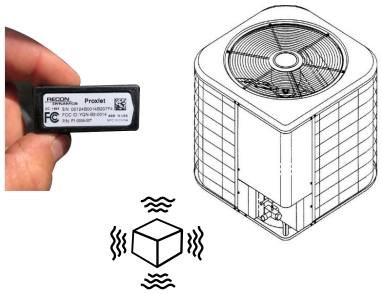

Specific combinations of temperature and humidity over time lead to mold growth. Real-time temperature and humidity captured every 2 minutes is data enough to predict mold growth before it starts.

GET ALERTS ABOUT GROWTH CONDITIONS

Get TXT alerts automatically sent to teams on the ground to stop mold before it has a chance to start. Customize alerts for when local mold growth conditions align for a predetermined length of time.

DEPLOY DATA-BASED HVAC SOLUTIONS

Correlate airborne monitoring data and smart tags utilization data on HVAC equipment to make data-based decisions on how to optimize HVAC systems against mold growth conditions.

DOCUMENT, CENTRALIZE AND LEARN

Reliably enhance and sustain mold prevention efforts across all locations. Centralize analysis to share best practices without the delay of organizational silos.
