

Protect Active Spaces
During Renovations

RECON DYNAMICS
PILLAR

DUST | NOISE | CARBON MONOXIDE | PRESSURE | TEMPERATURE | HUMIDITY | DEW POINT

REMOTELY MONITOR THE MESSINESS OF CONSTRUCTION

Real-time environmental conditions data captured every two minutes on both sides of a renovation barrier assures you and your team that the mess of construction is only where it belongs even when you are not there to witness it.

GET ALERTS ABOUT THREATENING CONDITIONS

Remotely get TXT alerts when conditions in active spaces cross user defined thresholds. Stop the mess of construction in real-time from creeping into places where it does not belong.

OPTIMIZE WORKFLOW BASED ON REAL-TIME CONDITIONS

Temperature? Humidity? Dew point? Too high? Too low? These things affect everything from quality of power to the threat of burst pipes. Remote monitoring enables real-time response for optimization.

DOCUMENT AND DELIVER QUALITY WITH CONFIDENCE

Create a paper trail to support quality work that's repeatable. Centralize the analysis of minute-by-minute data sets across multiple sites to discover and deliver data-backed best practices without the delay or subjectivity frequently encountered by siloed organizations.
